

Dr Janis Nolde graduated as a medical doctor in 2018 from the University of Luebeck (Germany). During his medical degree, he studied medicine and statistics at the University of Birmingham (UK) and the University College London (UK). He also undertook a research project in the physiology of food intake during his degree. This study investigated crosslinks between brain activation detected by the means of functional magnetic resonance imaging and endocrine parameters that may determine what and how much we eat.

His clinical interest in Nephrology and his scientific passion for data management, programming and analysis led him to the Dobney Hypertension Centre where he is mainly involved in clinical studies and data management and analysis. He is also interested in the application of machine learning algorithms in clinical data. In his private time he enjoys reading, physical activity and watching movies.
